Idea: This will be an expansion of my midterm website that was themed around wizards and spells through the use of HTML, CSS, AND JS. My project seeks to expand on the unfinished work I had for my midterm. My JavaScript will be utilizing the div buttons I created in my last project, except this time, they'll be used to actually play my CSS animations. I'm going to make modifications to my Site layout to change a bit of the color scheme and make my nav bar more accessible. I might change the body's font as well to something with a bit more legibility because the size of the text might be hard to read for some people. One CSS animation I want to adjust is the Fireball to make it a bit more detailed, as opposed to having it be just a ball. I'm also considering adding a small ice beam-themed spell, which I can achieve with CSS pretty easily. Or I might just use a PNG and animate it with the same movement so that it can actually look like a fireball and not be just a red ball. Another thing I considered for more interactivity is a button that allows the user to vote for their favorite spell, with a basic counter system that adds one every time the user clicks it. Lastly, my next order of business is to change the design of my nav bar, as I was pretty dissatisfied with the look and had to settle for what I had. For the color Palette, I'm probably going to change it because for the darker shaded parts of the site, like the footer, it becomes hard for the user to actually read the text on there. I would like to incorporate a p5.js program I've worked with in the past as part of my site on its own page and modify it to fit the theme. For jQuery, I'll incorporate it into my animation that I'll have on my site.
